Bridging Voices, Building India

Turning citizen voices — in any Indian language — into the nation's development priorities

Build with AI: Code for Communities — Second Edition · Hack2skill × Google Cloud

Riddhi Agrawal ·  sevasetu-ai-yeke.onrender.com

THE PROBLEM

India's development feedback is fragmented

A villager's broken-road plea dies in a **panchayat register**, a **WhatsApp group**, or a **grievance portal** — three silos, never connected

Requests are **never aggregated and never comparable** — one road, one file, one officer

Public spending follows **legacy plans**, not live citizen demand — so gaps go unseen and money misses the mark

The impact of large **digital public infrastructure** goes unmeasured at ground level

The people most affected speak **22 languages** — and the systems ask them to type in English

Built for the people the system misses

Citizens — every language

Voice-first, no English, no forms, no office visit. Speak, type, or photograph a problem in the language they think in.

Rural & low-connectivity communities

No app installs, no literacy barrier — a phone call's worth of effort replaces a paperwork journey.

District & national policymakers

One live view of demand hotspots and scheme-mapped project recommendations to justify budget decisions.

Digital Public Infrastructure programs

A measurable feedback loop — where DPI landed, what changed, and where it's still needed.

One platform, two sides

Citizen side

Speak, type, or photograph a problem in **any Indian language**

AI turns it into a **structured, geo-tagged, urgency-rated** request

Transparent status: Received → Acknowledged → In progress → Resolved

Government side

Live dashboard of **district demand hotspots**

AI project recommendations mapped to **real national schemes**

Transparent priority score — auditable, not a black box

Core idea: turn millions of unstructured citizen voices into clear, location-based priorities that tell government **where money should go next**.

From voice to action in seconds

- 1 Speak, type, or photograph** — in any Indian language. The district is auto-detected where location permission is granted, with manual correction.
- 2 AI intake** transcribes, translates, classifies the category, and rates urgency **with a reason** — Gemini-assisted analysis is implemented, with a rule-based fallback in this demo build.
- 3** The request is stored in **Cloud Firestore** and synced live to every device.
- 4** Status is transparent: **Received** → **Acknowledged** → **In progress** → **Resolved**.

End-to-end Google AI

Layer	Google service	Role
Generative AI	Gemini API (Google AI Studio)	Intake, translation, urgency + reason, photo analysis, project recommendations, executive briefs
Geospatial	Google Maps JavaScript API	Demand hotspot map with satellite / hybrid views
Geocoding	Google Geocoding API	GPS coordinates → district identification
Backend	Firebase — Anonymous Auth + Cloud Firestore	Serverless, cross-device report sync, secured by committed Firestore rules
Voice	Web Speech + Google TTS voices	Voice-first, multilingual intake and readouts

Gemini integration is implemented; the live demo currently falls back to rule-based analysis while API authentication is being finalized. Production moves AI calls behind a Cloud Run proxy for key security and rate limits.

A decision instrument, not a complaint inbox

District **demand hotspots** plotted on a live map, with satellite and hybrid views

Transparent priority score: demand + urgency + infrastructure deficit + momentum + equity — auditable, not a black box

Gemini recommendations mapped to real schemes — Jal Jeevan Mission, PMGSY, Ayushman Bharat — with rationale and KPIs

AI **executive brief** in the officer's chosen language — the whole dashboard switches language with one click

Live KPI cards, category breakdowns, and district-level status tracking

From voices to decisions: individual requests become a ranked, mapped picture of where public investment should go next.

WHY IT'S DIFFERENT

Not another complaint portal

	Typical grievance portal	SevaSetu
Unit of analysis	One complaint → one file	Patterns across thousands of requests
Input	Typed form, mostly English	Voice / photo / text, any Indian language
Output	Routed to an officer	Ranked, scheme-linked investment priorities
Purpose	Reactive — fix this one	Proactive — where should the next ₹100 Cr go

SevaSetu complements India's grievance systems — it doesn't replace them. It turns them into a **planning intelligence layer**.

Community-first impact

Resilience

Flood, health, and infrastructure needs surface in hours — not in files that take months to reach a decision-maker.

Innovation

Gemini multilingual + vision applied to real civic data — a template for citizen-facing AI across government.

Cooperation

Citizens and government share one evidence base. Priorities are visible to both sides — trust through transparency.

Sustainability

Spending follows measured need, reducing waste — and every district gets a voice, not just the well-connected ones.

Live today, deployable tomorrow

- ✓ **Fully working prototype** — live deployed link, public repo, real serverless backend, committed security rules
- ✓ **₹0 to run** — Gemini free tier + Maps demo key + Firebase Spark plan (no billing, no servers to provision)
- ✓ **Scales from one district to 766** — serverless; Firestore scales automatically
- ✓ **HTTPS voice & GPS** — works on low-end phones, no app install needed
- ⚠ **Honest trade-off:** demo runs AI client-side → production moves Gemini behind a **Cloud Run proxy** (key security, rate limits, audit trail)
- ⚠ **Current status:** Gemini integration is implemented; the live demo runs the rule-based analysis path while API authentication is being finalized.

One codebase, every state

Multilingual by design — UI and AI both operate in the citizen's language, from Hindi to Tamil to Bengali

Serverless — no infrastructure to provision; Firestore scales automatically with demand

One priority engine for any district — feed demographic + infrastructure inputs, get ranked priorities

Roadmap: BigQuery national-scale analytics · Earth Engine climate & agriculture layers · WhatsApp / Dialogflow IVR ingestion · state DPI integrations
